Introduction

- 2 The Shape Denoising Problem
- 3 Experiments
- 4 Comparison of Results

э

- We are interested in methods for modeling the shape (contour) of a specific class of objects, e.g. horses.
- In this study the shapes are represented as binary images of a certain size, e.g. 128×128
- The focus of our study is to study shape denoising the task of recovering a shape corrupted by noise
- We will introduce six types of shape noise
- We will evaluate and compare the performance of seven shape modeling methods for shape denoising.

The Shape Denoising Problem

Shape denoising is the process of removing the noise from a shape, with the goal of obtaining a shape as close to the original shape as possible.

(a) Original shape

(b) Noisy shape

(c) Denoised shape

Figure: Shape denoising example. The noisy shape (b) has been obtained from the original shape (a) by a noise inducing process. A shape denoising method is used to obtain the denoised shape (c).

A Study of Shape Modeling Against Noise

October 16, 2022

4/37

Shapes are represented as binary images.

Figure: Examples of shapes used in this work.

< 6 b

Shape Alignment

- We used binary images of size 128×128 .
- All binary images were aligned to have the objects centered and of approximately the same size.

(a) mask image1 (b) aligned image1 (c) mask image2 (d) aligned image2

Figure: Two alignment examples from the Weizmann Horse Dataset.

Six types of noise

We study six different types of noise.

(a) original

The salt and pepper noise is obtained by flipping each pixel to its opposite value with a probability p.

Figure: Salt and pepper noise with different levels *p*.

< □ > < □ > < □ > < □ > < □ >

The circle noise is obtained by adding semicircles or punching holes at random locations on the boundary between the foreground and the background.

Figure: Circle noise with different levels.

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

Real Image Noise

- Noisy backgrounds are obtained by thresholding real images using various thresholds
- The shape background pixels are replaced with the noisy background

(a) sample 1 (b) sample 2 (c) sample 3 (d) sample 4

Figure: Examples of real image noise.

The shape foreground pixels are occluded using thresholded real images.

Figure: Examples of occlusion noise.

Detection Image Noise

Detection image noise is obtained as the segmentation of an object from a color or grayscale image using a trained CNN (convolutional neural network).

(b) color image (c) detection image noise

Figure: Example of detection image noise in the Weizmann Horse Dataset.

Thresholded Probability Noise

Uses a color image *I* and a binary image *M* representing the object in the image.

- Denote $C_1 = \{(x, y), M(x, y) = 1\}$ as the foreground region and $C_0 = \{(x, y), M(x, y) = 0\}$ as the background region.
- *k*-means clustering is used to partition the image into *k* clusters, obtaining cluster indices for all pixels *L* ∈ {1, 2, ..., *k*}^N.
- For cluster *i* ∈ {1,2,...,*k*}, obtain the number of pixels that belong to foreground or background:

$$N_{i1} = |\{(x, y) | L(x, y) = i \land (x, y) \in C_1\}|, N_{i0} = |\{(x, y) | L(x, y) = i \land (x, y) \in C_0\}|$$
(1)

• Then the probability map of color image *I* can be computed as follows:

$$P(x, y) = \frac{N_{j1}}{N_{j1} + N_{j0}}$$
, where $j = L(x, y)$. (2)

Thresholded Probability Noise

Then binary noisy shapes are obtained by applying different thresholds to the probability map P.

(a) object shape (b) color image (c) prob map

(d) threshold 0.04 (e) threshold 0.5 (f) threshold 0.98

A Study of Shape Modeling Against Noise

October 16, 2022

14/37

The Weizmann Horse dataset [Borenstein et al., 2004]:

- Contains 327 horse images and their corresponding mask images.
- 159 images were randomly selected as the training set S_{train}^{clean} and the other 168 images as the test set S_{test}^{clean} .

The Caltech-UCSD Birds 200 dataset [Welinder et al., 2010] contains photos of 200 bird species.

- We use 417 images of seven Flycatcher species in our experiments.
- 207 images were randomly selected as the training set S_{train}^{clean} and the other 210 images as the test set S_{test}^{clean} .

In our experiments, the criterion we use to estimate the performance of modeling against noises is Intersection over Union (IoU), also known as the Jaccard Index.

Figure: Computation of $IOU(A, B) = \frac{|A \cap B|}{|A \cup B|}$.

Noisy Image Datasets

We denote the set $\{S_{test}^{salt}, S_{test}^{circle}, S_{test}^{real}, S_{test}^{occlusion}, S_{test}^{detection}, S_{test}^{probability}\}$ as S_{test}^{all} .

Dataset	loU(begin)	0.5-0.6	0.6-0.7	0.7-0.8	0.8-0.9	0.9-1
Horse	S ^{salt}	1000	1000	1000	1000	1000
	Scircle	77	1000	1000	1000	1000
	Sreal	1000	1000	1000	1000	1000
	Stest	479	622	690	938	1779
	Stest	3	7	14	77	60
	$S_{test}^{probability}$	298	673	1095	1345	525
Bird	S_{test}^{salt}	1000	1000	1000	1000	1000
	S_{test}^{circle}	416	1000	1000	1000	1000
	S ^{real}	1000	1000	1000	1000	1000
	$S_{test}^{occlusion}$	435	556	809	972	1000
	$S_{test}^{detection}$	22	30	44	56	15
	$S_{test}^{probability}$	843	962	934	519	70

Table: Number of noisy test images in each noise category.

-------	-------	--------	-------

The following methods have been evaluated for shape modeling and denoising:

- Active Shape Model (ASM) [Cootes et al., 1995]
- Deep Boltzman Machine (DBM) [Salakhutdinov and Hinton, 2009]
- Centered Convolutional DBM (CDBM) [Yang et al., 2021]
- Energy Based Model (EBM) [Pang et al., 2020]
- U-Net [Ronneberger et al., 2015]
- DeepLab V3+ [Chen et al., 2018]
- Masked Autoencoder (MAE) [He et al., 2021]

UNet

- U-Net [Ronneberger et al., 2015]
 - A Fully Convolutional Network (FCN) with a symmetric architecture.
 - Encoder uses max pooling to shrink channel size
 - Decoding part uses skip connections from the encoder

Figure: Original U-Net architecture

< ロ > < 同 > < 回 > < 回 >

Masked Autoencoder (MAE)

The masked autoencoder (MAE) [He et al., 2021]

- Scalable self-supervised learner
- Trained to fill-in missing parts of an image

Figure: MAE architecture [He et al., 2021]

Thresholded Probability Noise Results

 Performance comparison of each methods against thresholded probability noise

Figure: Performance on thresholded probability noise data $S_{test}^{probability}$

Comparing the methods:

- Experiments reveal that MAE and U-Net are the best shape denoising methods we evaluated for all six types of noise.
- DeepLabv3+ is the third best shape denoising method for the six noise types in most situations.
- EBM outperforms CDBM on all six noise types, especially when dealing with real image noise.

Comparing the noise types:

- The salt and pepper noise is the easiest to deal with, followed by real image noise.
- Circle noise and occlusion noise are more challenging than the above two, especially when the noise level is high.
- The most challenging noises among these six are the thresholded probability noise and detection image noise.

We presented a study of methods for shape denoising

- Shapes are represented as binary images
- Shapes were aligned by translation and scaling
- We introduced six types of shape noise
- We evaluated seven shape modeling/denoising methods on these types of noise

Future work:

- Study shape denoising in the wild, where the shapes are not aligned
- Study methods trained on aligned shapes vs. methods trained on unaligned shapes
