November 19, 2012

1. The preceding figure is the probability density curve of the random variable X.

- (a) Find b so that f(x) is a probability density function.
- (b) What is  $P(-4 \le X \le 3)$ ?
- (c) What is P(X = 1)?
- 2. A survey report states that 65% of women over 30 visit their doctors for a physical exam at least once in two years. 6 adult women are randomly selected and asked whether or not they have had a physical exam in the past 2 years. Let X represent the number of women (out of the 6 asked) who have had a physical exam in the past 2 years.
  - (a) What is the expected value of X?
  - (b) What is the probability that fewer than 3 of the women asked have had a physical exam in the past 2 years?
  - (c) What is the probability that exactly 5 of the women asked have NOT had a physical exam in the past 2 years?

- 3. The bonding strength of a drop of plastic glue is normally distributed with mean 100 pounds and standard deviation 8 pounds.
  - (a) What is the probability that the bonding strength is between 90 and 110 pounds?
  - (b) A broken plastic strip is repaired with a drop of this glue and then subjected to a test load of 98 pounds. What is the probability that the bonding will fail?
  - (c) The manufacturer of the glue wishes to know the value v for which 98.5% of bonding strengths are less than v. What is the value of v?
- 4. A player throws a fair die and simultaneously flips a fair coin. If the coin lands heads, then she wins twice, and if tails, then one-half of the value that appears on the die. Determine her expected winnings.
- 5. Because 12% of the reservation holders are no-shows, a U. S. airline sells 448 tickets for a flight that can accomodate 400 passengers. For the following questions, use the normal approximation to the binomial distribution. Be sure to apply continuity correction. (Because we are using a continuous r.v. to approximate the integer-valued binomial r.v., continuity correction is necessary and is given by  $P(X = i) \rightarrow P(X \in$  $(i - 0.5, i + 0.5)), P(X \ge i) \rightarrow P(X \ge i - 0.5), P(X > i) = P(X \ge i + 1) \rightarrow P(X \ge$  $i + 1 - 0.5), P(X \le i) = P(X \le i + 0.5)).$ 
  - (a) Find the approximate probability that one or more reservation holders will not be accomodated on the flight.
  - (b) Find the approximate probability of having fewer than 380 passengers on the flight.
- 6. A casino offers a game of chance for a single player in which a fair coin is tossed at each stage. The pot starts at 1 dollar and is doubled every time a head appears. The first time a tail appears, the game ends and the player wins whatever is in the pot. Thus the player wins 1 dollar if a tail appears on the first toss, 2 dollars if a head appears on the first toss and a tail on the second, 4 dollars if a head appears on the first three tosses and a tail on the third, 8 dollars if a head appears on the first three tosses and a tail on the fourth, and so on. In short, the player wins  $2^{k-1}$  dollars if the coin is tossed k times until the first tail appears.
  - (a) What is the expected payout?
  - (b) What is the expected payout if the coin is biased with success probability 1/3?
- 7. Let X and Y be independent geometric random variables with the same parameter p. Find the value of

$$P(X = i \mid X + Y = n).$$

Argue the expression obtained above without doing any computation.
