Chapter 1

Introduction

1.1 Introduction

1.1.1 Problem Statement

The objective of this assignment is that if given observed noisy images, the goal is to perform a Bayesian analysis of the data. We will assume a prior probability model and an observation model to obtain a posterior density, and will generate samples from the posterior

Chapter 2

Methodology

2.1 General Approach

Given an distorted image, by the model $D = I + W$, where $W \sim N(0, \sigma_2^2)$, the approach must obtain an estimate for the posterior density of the image, $I \in \mathbf{R}^{m \times n}$. The image of I , a matrix of R.V's forming a Markov Random field, is a model that has prior knowledge. Each pixel, $I_{j,k}$ is a conditional density that is only dependent on the values of its vertical and horizontal neighbors of the given pixel. Given that μ is the mean of the horizontal and vertical pixels of $I_{j,k}$, if is known that $I_{j,k} \sim N(\mu, \sigma_1^2)$

2.1.1 Bayesian Analysis and Methods

Using Bayesian methods, we can estimate the posterior density of I , by sampling from the posterior of each $I_{j,k}$, given $D_{j,k}$ by using the following Bayesian rules.

$$f(I|D) = f(D|I) \frac{f(I)}{f(y)} \quad (2.1)$$

where $f(y) = \int f(D)f(I)dy$.

As stated above, since the conditional density is dependent only on certian neighbor of values, can form the following

$$f(I_{j,k}|D_{j,k}, I_{j+1,k}, I_{j-1,k}, I_{j,k+1}, I_{j,k-1}) = f(D_{j,k}|I_{j,k})f(I_{j,k}) \quad (2.2)$$

Since $I_{j,k} \sim N(\mu, \sigma_1^2)$ and $D_{j,k} \sim N(I_{j,k}, \sigma_2^2)$ then

$$f(I_{j,k}|D_{j,k}, I_{j+1,k}, I_{j-1,k}, I_{j,k+1}, I_{j,k-1}) \sim N(\mu, \sigma_1^2) \cdot N(I_{j,k}, \sigma_2^2) \quad (2.3)$$

2.1.2 Metropolis Hastings

Metropolis Hastings is used in to approximate sampling from complicated distributions. In general, the goal is to generate samples of a random variable distributed according to the density, say $f(x)$. Moreover, we assume that the conditional density, say $q(y|x)$ with the following properties

1. $\forall x$, sampling from $q(y|x)$ is possible

2. The support of q contains the support of $f(x)$
3. $q(y|x)$ is known and symmetric in x and y .

Given a function and a conditional density with the above properties, the M-H algorithm is the following

1. Choose an initial condition x_0 in support of $f(x)$
Construct x_n using the following steps:
2. Generate $y \sim q(y|x_t)$
3. Update the state to x_{t+1} by using

$$x_{t+1} = \begin{cases} y & \text{probability } \rho(x_t, y) \\ x_t & \text{probability } 1 - \rho(x_t, y) \end{cases} \quad (2.4)$$

where $\rho(x, y) = \min \left(\frac{f(y)q(x|y)}{f(x)q(y|x)}, 1 \right)$. Under certain conditions, ρ can be simplified, as such the case when

1. In cases where the density is independent of the current state, $q(y|x) = q(y)$, then becomes an independent M-H. Therefore the function becomes

$$\rho(x, y) = \min \left(\frac{f(y)q(x)}{f(x)q(y)}, 1 \right) \quad (2.5)$$

2. When $q(y|x)$ is symmetric in x and y , then the likelihood ratio appears, because the function becomes

$$\rho(x, y) = \min \left(\frac{f(y)}{f(x)}, 1 \right) \quad (2.6)$$

2.1.3 Gibbs Sampler

Another technique for generating Markov Chains is the process of Gibbs Sampling. The goal is to generate samples by constructing a MC in \mathbf{R}^n , from a random vector, (x_1, x_2, \dots, x_n) , with joint pdf, $f(x_1, x_2, \dots, x_n)$. In order to use Gibbs sampling for this problem, will assume the conditional densities are known, so $f(x_i|y_i)$ for $i \neq j$. Therefore will obtain univariate densities to apply the algorithm to update from x^t to x^{t+1}

1. Generate $X_1^{t+1} \sim f_1(x_1|X_2^t, X_3^t, X_4^t)$
2. Generate $X_2^{t+1} \sim f_2(x_2|X_1^{t+1}, X_3^t, X_4^t)$
3. Generate x_1^{t+1}, x_2^{t+1}

In the procedure, each pixel, $I_{j,k}$ is processed until a complete sweep which will result in a new prior distribution, which in turn will be used in the next iteration. Therefore, in order to do a complete sweep, will sample from the posterior using the Gibbs sampling method, and update the posterior on each sequence.

Chapter 3

Matlab Code

3.1 Main Code

```
clear
clc

load DataFile1.mat
I=D1;
[n1,n2]=size(D1);
sigma1=10;
sigma2=30;

figure(1)
imagesc(I(:,:));
title('Initial Image');
saveas(figure(1),['Initial Image DataFile5.png']);

for i=1:6;
    for j=1:n1;
        for k=1:n2;
            mid = mean1(j,k,I);
            if rand>=0.5;
                I(j,k) = random('normal',mid,sigma1,1,1);
            else
                I(j,k)=I(j,k);
            end;
        end;
    end;
end;

W=random('normal',0,sigma2,n1,n2);
D=I+W;

I2 = Gibbs(I,D,sigma1,sigma2);
I=I2;
```

```

figure(2)
subplot(2,3,i);
imagesc(I);
figname = sprintf('Image of sweep %d',i+1);
title (figname);
saveas(figure(2),['Pictures of sweep' int2str(i) ' of DataFile1.mat (sigma=10).png']);
end;

```

3.2 MH Code

```

function [mid] = mean1(j,k,x)
[n1,n2]=size(x);
    if (j==1) && (k==1)
        mid=(x(j,k+1)+x(j+1,k))/2;
    end;

    if (j==1) && (k==n2)
        mid=(x(1,k-1)+x(j+1,k))/2;
    end;

    if (j==n1) && (k==1)
        mid=(x(j-1,k)+x(j,k+1))/2;
    end;

    if (j==n1) && (k==n2)
        mid=(x(j,k-1)+x(j-1,k))/2;
    end;

    if (j==1 && k~=1 && k~=n2)
        mid=(x(j+1,k)+x(j,k-1)+x(j,k+1))/3;
    end;

    if (j==n1 && k~=1 && k~=n2)
        mid=(x(j-1,k)+x(j,k-1)+x(j,k+1))/3;
    end;

    if (j~=1 && j~=n1 && k==1)
        mid=(x(j-1,k)+x(j+1,k)+x(j,k+1))/3;
    end;

    if (j~=1 && j~=n1 && k==n2)
        mid=(x(j-1,k)+x(j+1,k)+x(j,k-1))/3;
    end;

    if (j~=1 && j~=n1) && (k~=1 && k~=n2)
        mid=(x(j-1,k)+x(j+1,k)+x(j,k+1)+x(j,k-1))/4;
    end;

```

3.3 Gibbs Code

```
function [gib] = Gibbs(I,D,sigma1,sigma2)
[n1,n2]=size(I);
    for j=1:n1;
        for k=1:n2;
            mid=mean1(j,k,I);
            mu = (mid/sigma1+D(j,k)/sigma2)*(1/((1/sigma1)^2 +(1/sigma2)^2));
            sd = sqrt(1/((1/sigma1)^2+(1/sigma2)^2));
            gib(j,k)=random('normal',mu,sd,1,1);
        end
    end
end
```

Chapter 5

Conclusion

In this paper, it was found that the combinations of techniques applied above improved the quality of the images at $\sigma_1 = 10$. As σ_1 increased, the images appeared to be more distorted, by adding more noise. As seen in plots, for smaller values of σ_1 , the images are closer to I , where increasing σ_1 , images appear closer to D
