

# STA 4322-STA 5325 Exam 2

April 28, 2022

Student's name:

Book: yes no

Notes: yes no

This is a 400 points, show your work, 120 minute exam, partially covering Chapters 5 - 10 from your textbook as well as lecture notes after midterm and problems assigned as homework. There is a deduction of 15% from your score if you use your notes or your book, and of 25% if you use them both. Good luck!

**EXERCISE 1. (60 points)** *A book editor packages high school textbooks in boxes of 40. It is presumed that, on average, such a textbook weighs 2 pounds, with a known standard deviation of 0.16 pounds. If 40 such textbooks selected from a random package, weigh together 81 pounds, at level  $\alpha = 0.05$  is the average weigh of a randomly selected textbook significantly higher than the presumed mean weigh?*

**EXERCISE 2. (60 points)** *Given  $x_{a,1}, \dots, x_{a,n_a}$  two random samples from independent probability distributions  $Q_a, a = 1, 2$ , having finite means and variances, derive a large sample interval estimate at confidence level  $1 - \alpha$  for the difference between their two means  $\mu_1, \mu_2$  in terms of these two samples only, if  $\lim_{n \rightarrow \infty} \frac{n_1}{n} = \lambda \in (0, 1)$ , where  $n = n_1 + n_2$ .*

**EXERCISE 3. (60 points)** *Given two large random samples  $x_{a,1}, \dots, x_{a,n_a}$  from independent Bernoulli trials with probabilities of success  $\theta_a, a = 1, 2$ , derive an interval estimate at confidence level  $1 - \alpha$*

for the difference  $\theta_1 - \theta_2$  between these probabilities of success, in terms of these two samples only, if

$\lim_{n \rightarrow \infty} \frac{n_1}{n} = \lambda \in (0, 1)$ , where  $n = n_1 + n_2$ .

**EXERCISE 4. (70 points).** Assume  $x_1, \dots, x_n$  is a large random sample from a Beta distribution  $\text{Beta}(\theta, 1)$ . Construct a rejection region of size  $\alpha$  for the hypothesis testing problem  $H_0 : \theta = 1$  vs. the alternative  $H_1 : \theta > 1$ .

**EXERCISE 5. (70 points).** Assume  $x_1, \dots, x_m$  and  $y_1, \dots, y_n$  are random sample from independent exponential distributions with means  $\theta_1$ , respectively  $\theta_2$ . Find a UMPU test of size  $\alpha$  for the hypothesis testing problem  $H_0 : \theta_1 \leq \theta_2$  vs. the alternative  $H_1 : \theta_1 > \theta_2$ .

**EXERCISE 6. (80 points)** Let  $(x_1 y_1)^T \dots, (x_n y_n)^T$  be a random sample from a bivariate normal distribution  $\mathcal{N}_2(\mu, \Sigma)$ , where  $\mu = (\mu_X \mu_Y)^T$  and  $\Sigma = \begin{pmatrix} \sigma_X^2 & \rho \sigma_X \sigma_Y \\ \rho \sigma_X \sigma_Y & \sigma_Y^2 \end{pmatrix}$ . Derive a LR test of asymptotic size  $\alpha$  for the hypothesis testing problem  $H_0 : \mu_X = \mu_Y$  vs.  $H_1 : \mu_X \neq \mu_Y$ .

Table of areas under the standard normal density curve from 0 to x.
